Pressurized Water Reactor
Chemical & Volume Control System (Primary Loop Chemistry)

Resins used for nuclear power primary side chemical control must purify water in a lithium or potassium and borate environment. Our IRN-grade ion exchange resins have proven to be the premier resins chosen to protect nuclear power plants throughout the world.

<tr>
<td>AMBERLITE™ IRN99 H</td>
<td>Delithiation/CANDU Moderator</td>
<td>Premium 16% DVB uniform particle size cation resin with very high capacity and oxidative stability. Highest Cs selectivity and capacity for long runs and reduced waste and exposure. The high oxidative stability results in reduced reactor water sulfate concentration in PWR primary applications.</td>
<td>SAC</td>
<td>GEL</td>
<td>2.50</td>

<td>AMBERLITE™ IRN360 H/OH</td>
<td>Delithiation &amp; CVCS</td>
<td>Gel type mixed bed composed of 2/3 high capacity UPS cation resin AMBERLITE™ IRN97 H and 1/3 AMBERLITE™ IRN78 OH Resins on a volume basis. High cation content allows its use for Lithium control like a cation resin, then as a CVCS mixed bed when exhausted in Lithium.</td>

WARNING: Oxidizing agents such as nitric acid attack organic ion exchange resins under certain conditions. This could lead to anything from slight resin degradation to a violent exothermic reaction (explosion). Before using strong oxidizing agents, consult sources knowledgeable in handling such materials.
